# The Role of AI in Fighting Current & Future Pandemics

**Esam Alwagait, PhD**  
Director, National Information Center

# Outline

1. Introduction

2. Responses to COVID-19 That Employed AI Technology

3. Future Role of AI in Conjunction with Digital Health

4. Challenges That Could Keep AI Behind

# Outline

2. Responses to COVID-19 That Employed AI Technology

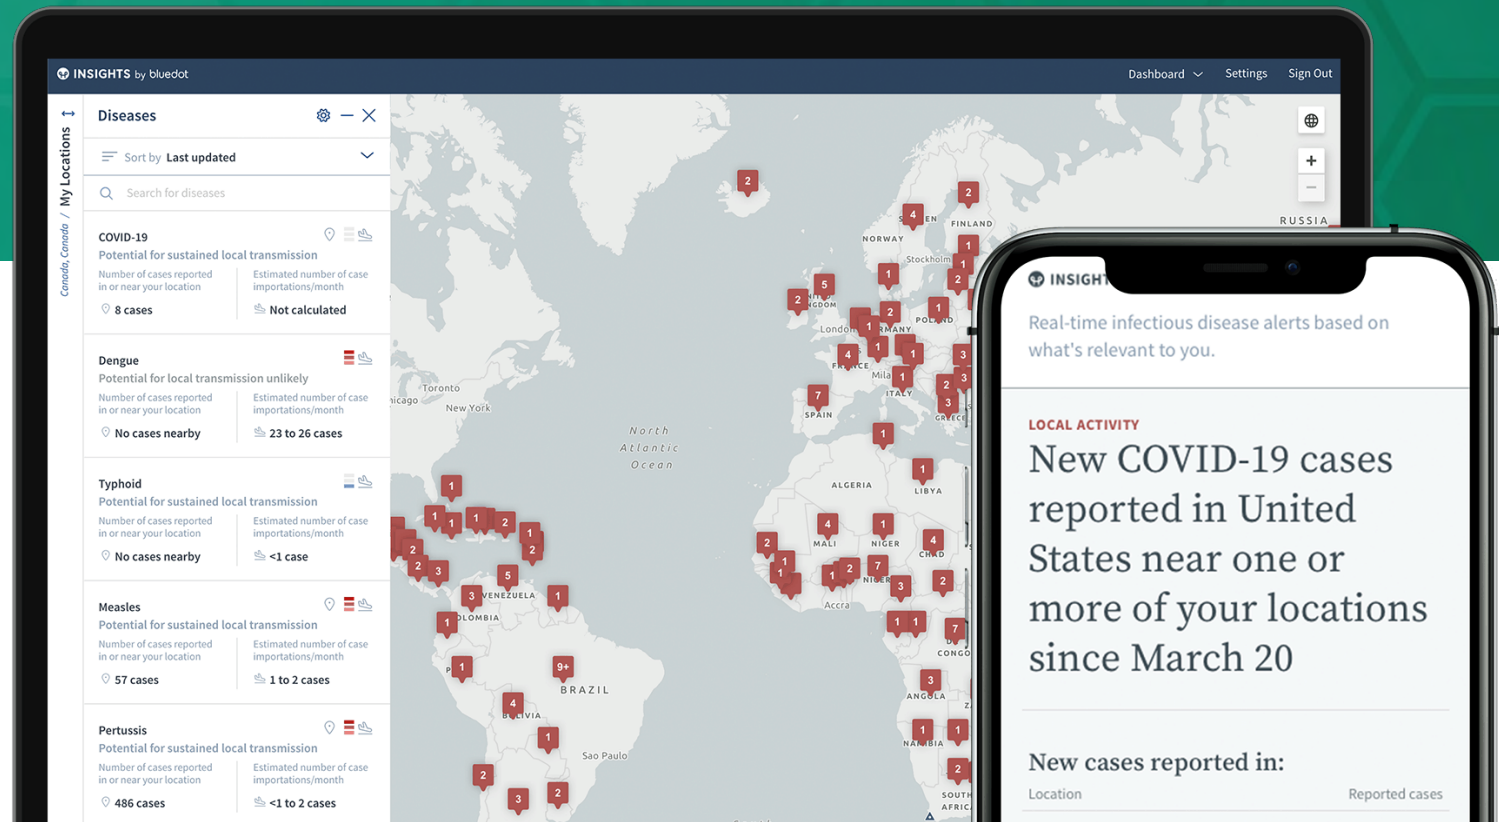

3. Future Role of AI in Conjunction with Digital Health

4. Challenges That Could Keep AI Behind

# So, AI you Say?

# Introduction – The Fight Against Pandemics

“In the fight against pandemics, medical staff are the first to respond, forming the front line, and risking their own lives to save the lives of others

**However**, behind that front line and in support of it, the war should be fought by various entities taking advantage of the latest technologies and AI to transform the war into a domain where people have the advantage over the pandemic.

## Epidemics with different behaviors are occurring very frequently

Already in the first 2 decades of the 21<sup>st</sup> century, the world has experienced 12 different epidemics, 2 of which developed to pandemics.

## **Pandemics are more than just COVID-19**

Lethality, sources, and spreading nature of different diseases require different precautions and strategies, & what is considered acceptable for COVID-19 is not necessarily functional for others.

**In shaping the future guard against pandemics,** we should push towards a holistic approach that considers different behaviours of epidemics and tackles them in multiple domains

# Outline

1. Introduction

2. Responses to COVID-19 That Employed AI Technology

3. Future Role of AI in Conjunction with Digital Health

4. Challenges That Could Keep AI Behind

# AI-Based Responses to COVID-19 can be categorized under 5 Major Categories

AI and statistical models that rely on current & previous pandemic data, health data, and demographic data to predict the future development of the pandemic and suggest best responses

AI-based models and mobile apps that are used to track the spread of the disease on individual level to help contain the pandemic

Efforts related to training AI models to find the most effective approved medicines for the pandemic based on its chemical properties in addition to efforts in developing vaccines by employing AI

Pairing AI with latest technology to implement monitoring solutions that can be used in quarantine environments and prevent risking medical staff lives

Pairing AI with latest technology to bring fast, touchless, and reliable solutions that can serve as initial identification of infection

# AI-Based Responses to COVID-19

 **KSA COVID-19 Index**

Geographical & Demographical Patterns   Mortality Prediction   COVID-19 Spreading Prediction   Beds & ICU Demand Prediction   Ventilators Demand Prediction

---

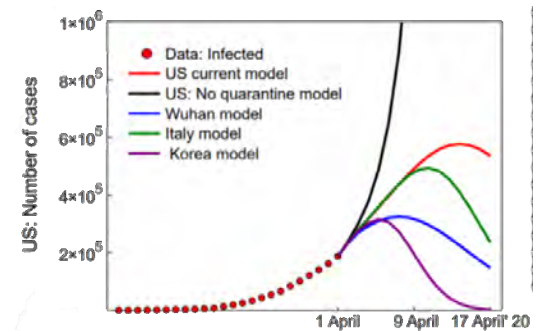

**Decision Making Support Through**

- Assessing Health Resources Management
- Predicting Healthcare Demand for Procurement
- Analyzing Policies Impacts
- Providing transitional plans from curfew to normality

 **Quarantine Impact Prediction on COVID-19 Spread**

Complement SEIR with AI   Study quarantine measures from different countries   Future cases based on quarantine measures

---

# AI-Based Responses to COVID-19

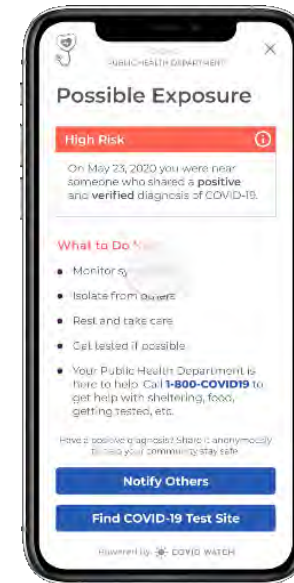

## TAWAKALNA App

- Alert the user upon potential contacts with infected cases.
- Automatically alert the user upon permit violation
- Alerting the user regarding the geographical permit limit

## Covid Watch

- Works by interchanging anonymous IDs when two devices come in close proximity.
- The app doesn't rely on GPS or involve any tracking.

# AI-Based Responses to COVID-19

## Harvard HII

Human Immunomics Initiative (HII) is an initiative established by Harvard Chan School to design AI-powered models of immunity that can accelerate vaccine development and testing for a wide range of diseases, including COVID-19.

## BenevolentAI

Benevolent build technology in the service of science - to augment human intelligence and inspire the discovery of new medicines for the thousands of diseases that have no treatment.

Medicine search through AI

Focuses on Approved medicines

finds medicines that can be useful with COVID-19

# AI-Based Responses to COVID-19

## Emerald

Touchless sensor & ML platform

Performs health analytics

Remote monitoring of patients without direct access

## X-Ray Inspection

The Royal Bolton Hospital has used an artificial intelligence system (qXR) to help diagnose emerging coronavirus patients through X-rays.

# AI-Based Responses to COVID-19

## Cough Against COVID

Collecting Cough Sounds to Build dataset that can be used to train a model for diagnosing COVID-19 through cough sound

**What you'll need to submit**

- Basic details**  
Answer a few questions about yourself, your symptoms and medical history
- Picture of COVID-19 test result**  
If you have the result on-hand, please click a picture and share it with us. Don't worry if you don't have this, you can still contribute. (See our note on [submissions](#).)
- Sound recordings**  
We need 3 samples of cough sounds and a simple voice recording.

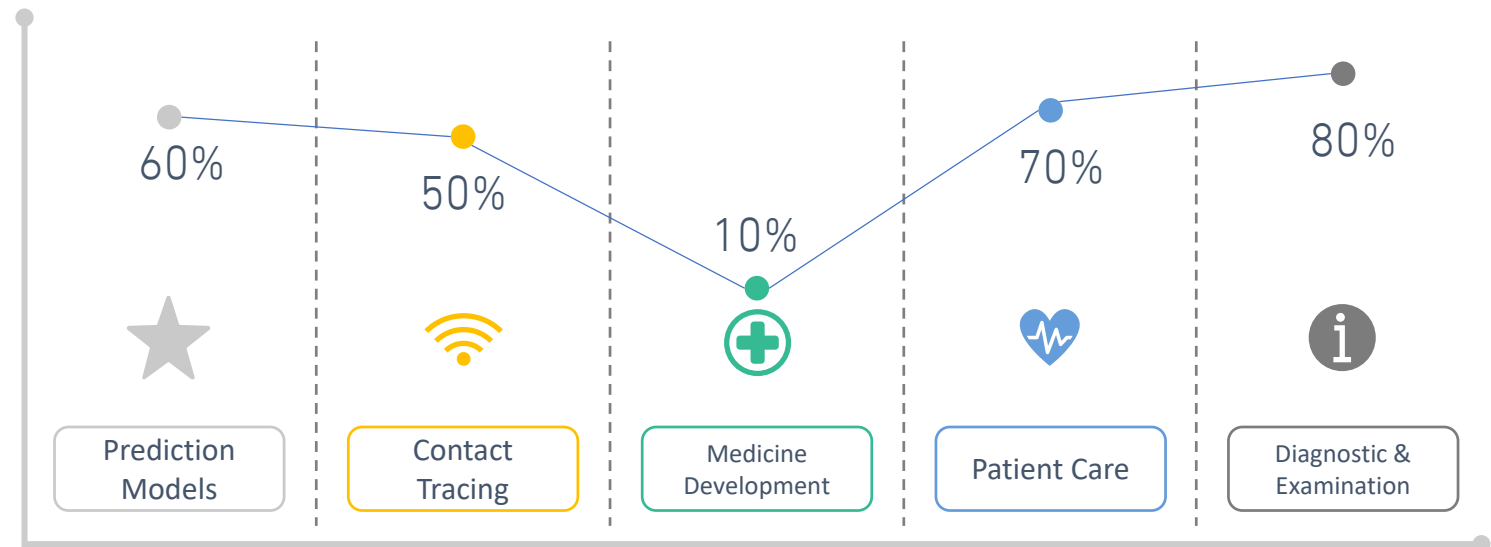

## Remote Diagnostic

The 'Smart AI Epidemic Prevention Solution' can detect a fever within an accuracy of 0.3°C because it integrates sophisticated AI algorithms with infrared thermal technology.

# The Role of AI in Current Pandemic

## Prediction Models

Prediction models are not very accurate and change frequently because of the rapid daily changes

## Patient Care

Patient care have been used to handle 100s of requests and filter the severe cases based on AI which was useful in managing the pandemic

## Contact Tracing

Many efforts have been done to trace spread while taking privacy into account, but collaboration is required to insure effectiveness

## Diagnostic & Examination

Many effort have been done under this track with high effectiveness. It is used in many situations and helped identifying infections from big crowds

## Medicine Development

This track is not that active as it requires a lot of custom data and knowledge in addition to high processing capability

And yet, the current AI capability is not truly utilized due to being

### Reactive not Proactive

Time is a critical factor when it comes to epidemics. Lagging the event could make it develop into a pandemic & go out of control, or isn't that what actually happened?

### Non-Complementary

COVID-19 has been approached from different angles. However, those efforts don't contribute to, or complement, each others where it is possible to do so.

# Outline

1. Introduction

2. Responses to COVID-19 That Employed AI Technology

3. Future Role of AI in Conjunction with Digital Health

4. Challenges That Could Keep AI Behind

# AI Role in Fighting Future Pandemics

AI Can Lead the Fight Against Future Pandemics By Developing 3 Pillars

Be Proactive

---

Powered by smart health services, AI should keep harvesting health data from all sources to detect epidemics at their very early stages

Contain the Spread

---

Relying on IoT, contact tracing should be linked to digital surveillance to automatically trace contacts at early stages and chase the spread

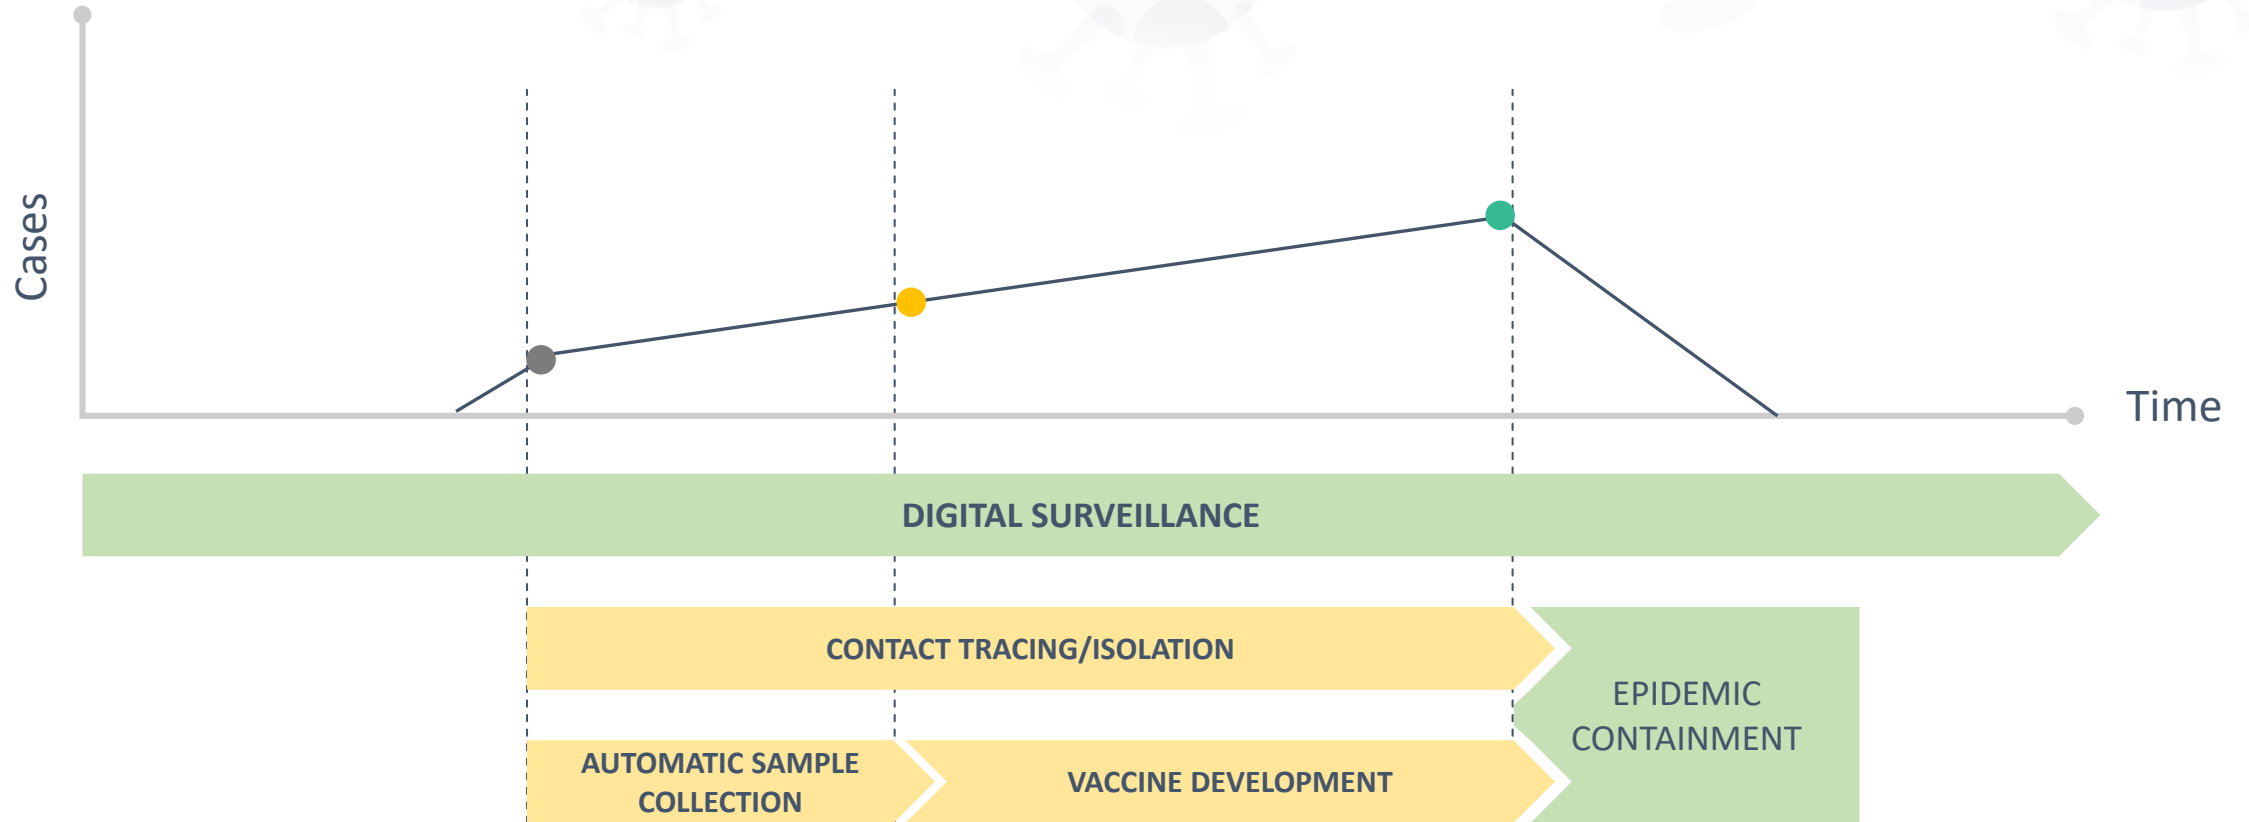

Target the Root of the Problem

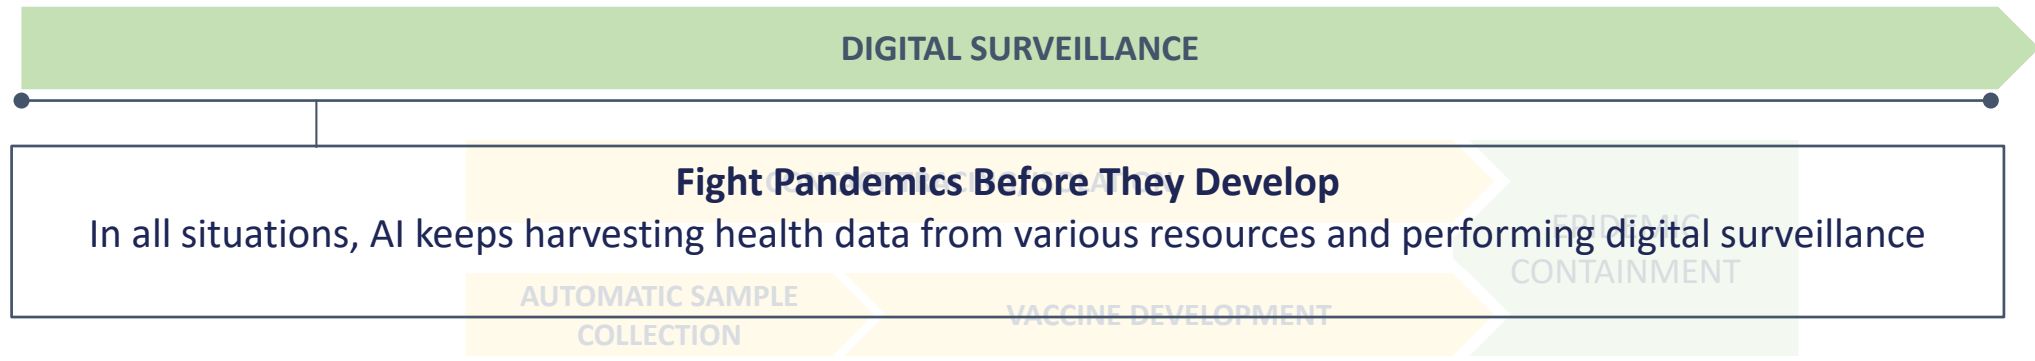

---

With both digital surveillance & contact tracing in operation, time can be spared, & reliable data can be fed to highly developed technology to analyze the virus and develop a vaccine

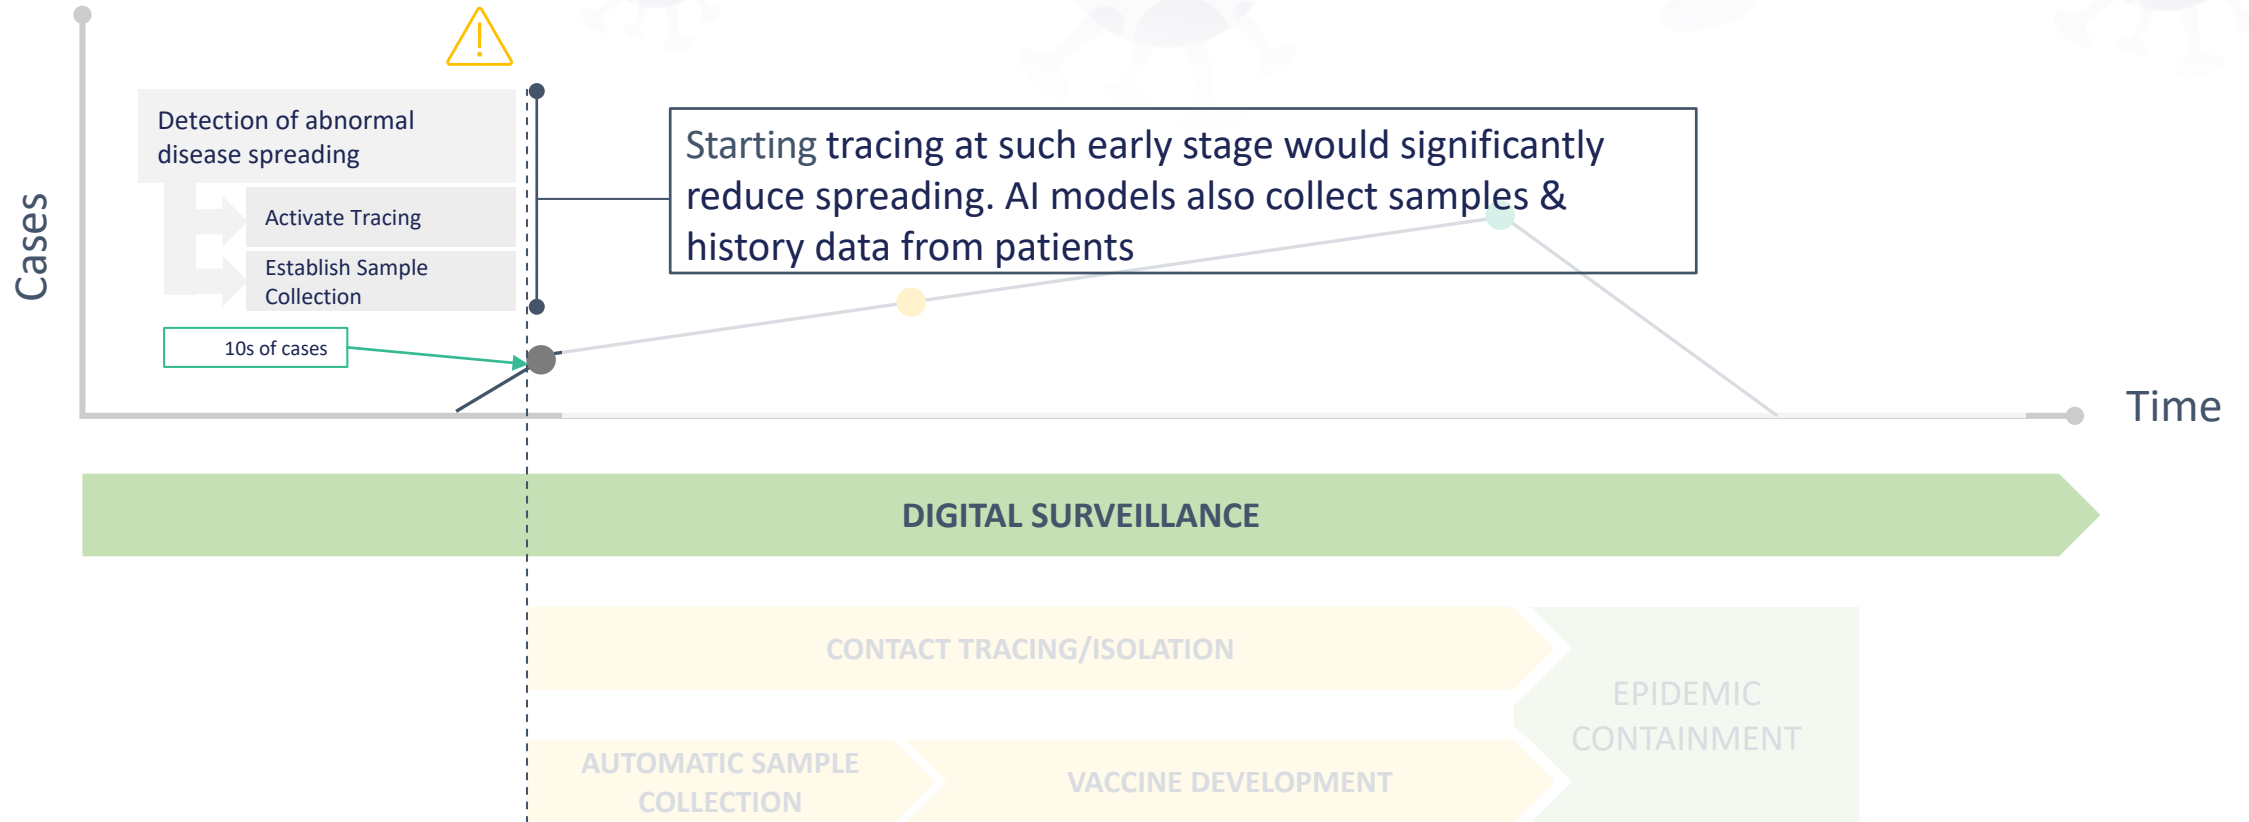

# AI Role in Fighting Future Pandemics

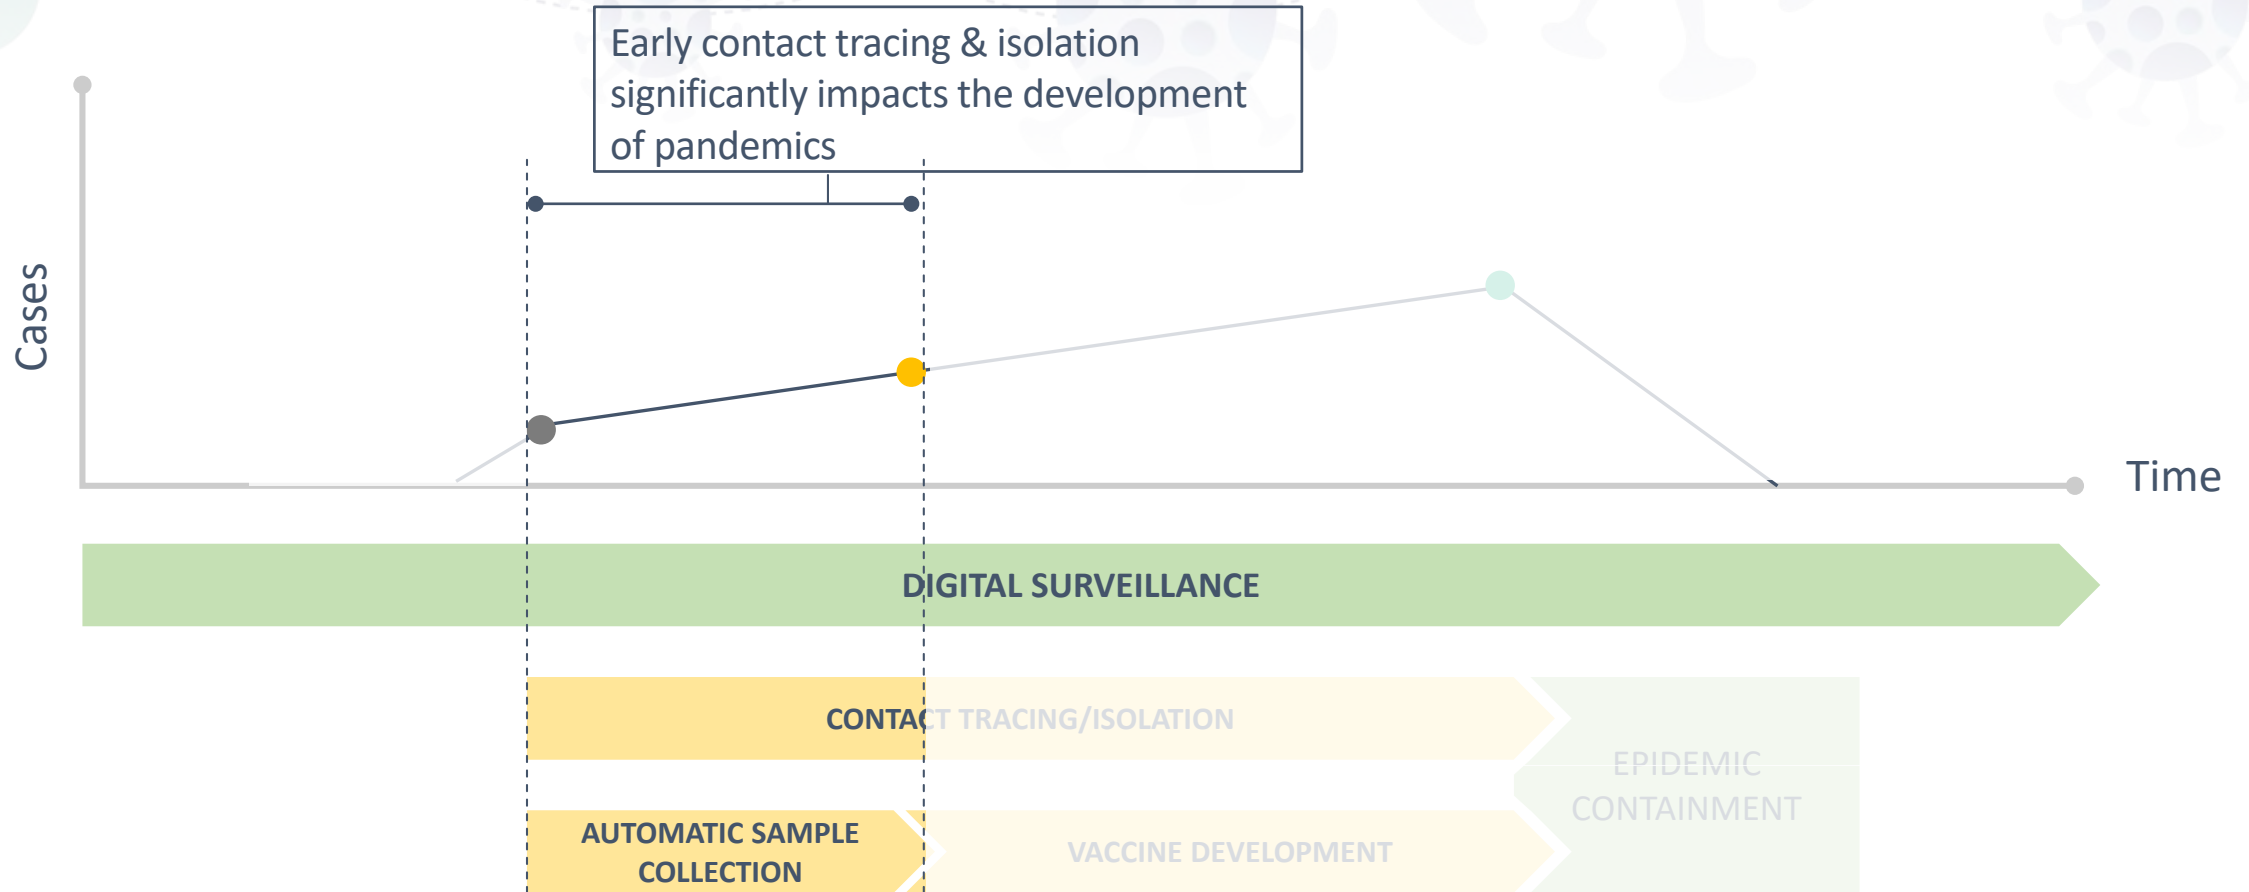

# AI Role in Fighting Future Pandemics

# AI Role in Fighting Future Pandemics

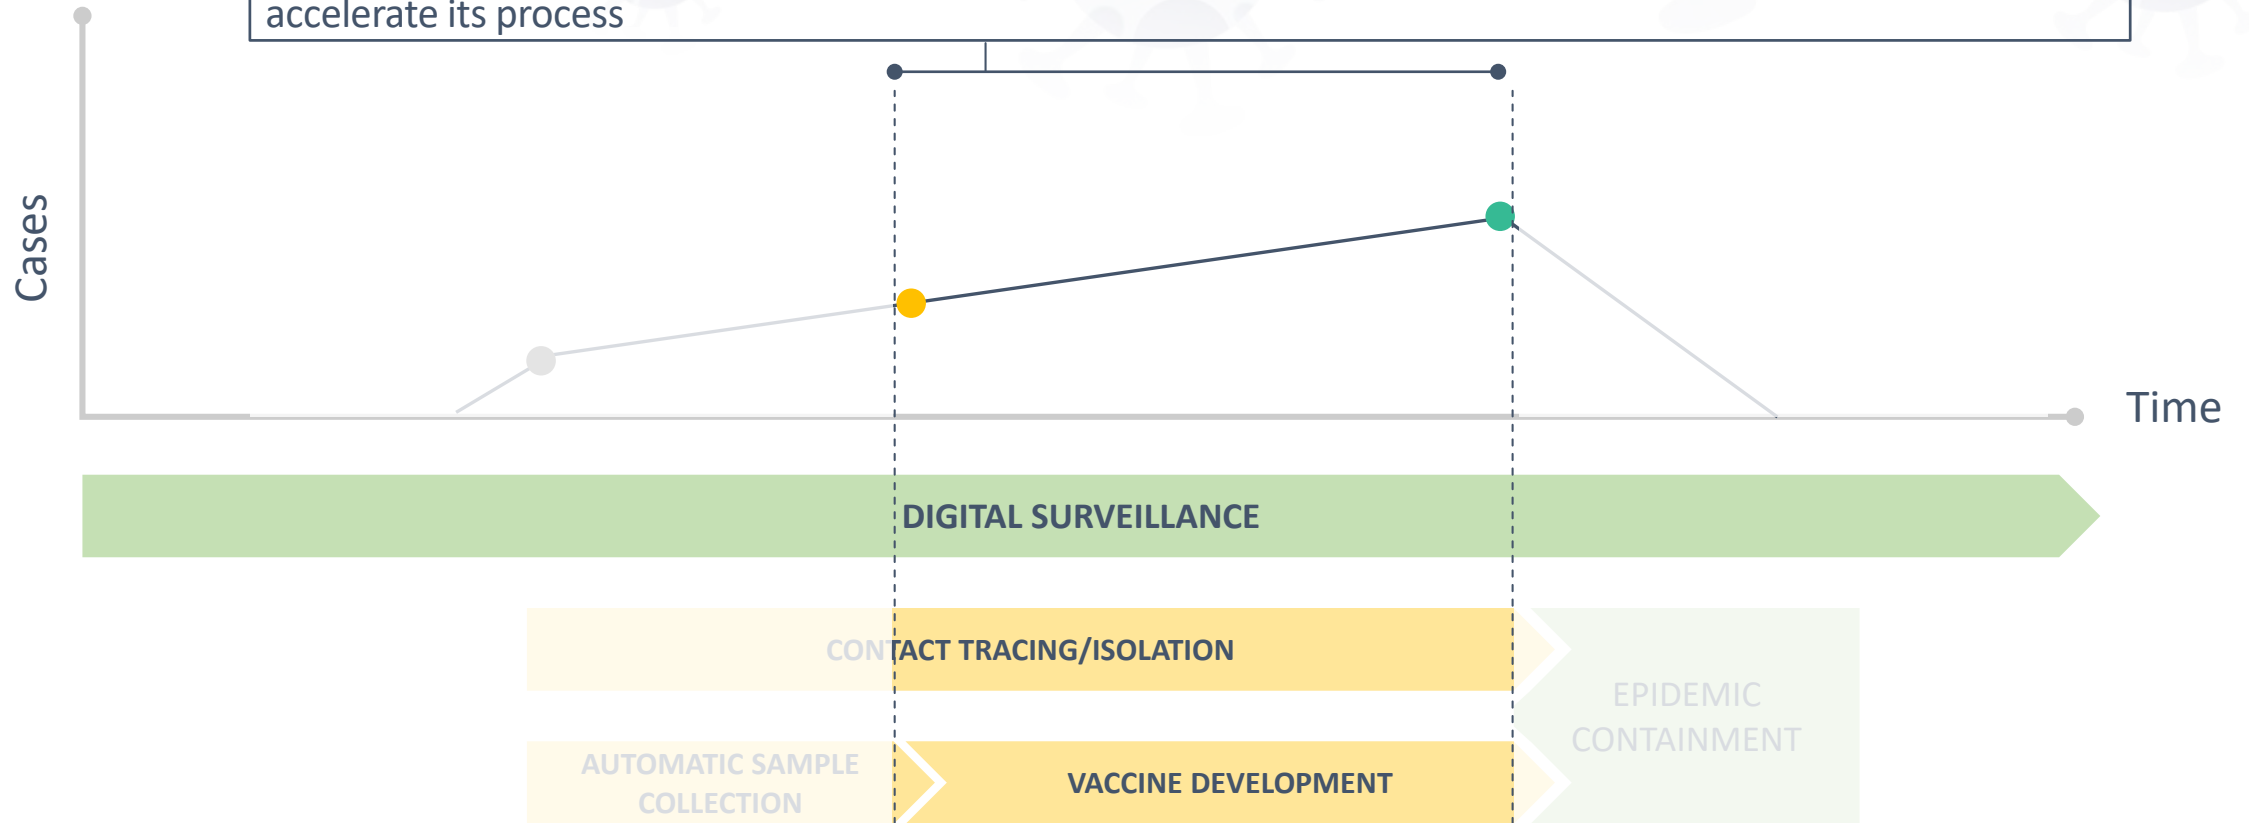

# AI Role in Fighting Future Pandemics

# AI Role in Fighting Future Pandemics

AI takes relatively long time to decipher virus protein structure. Early detection of epidemic along with early contact tracing and sample collection into centralized pole, all spare the time for vaccine development and accelerate its process

# Outline

1. Introduction

2. Responses to COVID-19 That Employed AI Technology

3. Future Role of AI in Conjunction with Digital Health

4. Challenges That Could Keep AI Behind

# Challenges That Could Keep AI Behind

1

Processing Capability

2

Data

3

Interventions
